ANSWERS.

1. The two methods are distinct where GET method adds the encoded data to the URI while in case of POST method the data is appended to the body rather than URI. Additionally, GET method is used for retrieving the data. Conversely, POST method is used for storing or updating the data.
2. Field validation rules Use a field validation rule to check the value that you enter in a field when you leave the field. Record validation rules Use a record validation rule to control when you can save a record (a row in a table).
3. The mail () function allows you to send emails directly from a script.
4. A) integer B) local variable c) john
5. Echo $userFirstName. $userLastName. "is only". $userAge;
6. 4
7. $myArgument
8. "John","smith"
9.

Class Definition

Circle
-radius:double=1.0 -color:String="red"
+Circle() +Circle(r:double) +Circle(r:double,c:String) +getRadius():double +getColor():String +getArea():double

Instances

c1:Circle	c2:Circle	c3:Circle
-radius=2.0 -color="blue"	-radius=2.0 -color="red"	-radius=1.0 -color="red"
+getRadius() +getColor() +getArea()	+getRadius() +getColor() +getArea()	+getRadius() +getColor() +getArea()
